Keywords: data, quality, exchange, standards, integration

Environmental science is often limited by the quality, timeliness, and accessibility of data. The Exchange Network establishes a nationwide, secure, Internet-based system to enable the real-time exchange of environmental data among states, Indian tribes, and the U.S. Environmental Protection Agency (U.S. EPA). Relying on data standards and cutting-edge technologies, like Web services, the Exchange Network improves the quality of our environmental science by enabling data sharing and integration across organizations faster and more easily than ever before.
